

**Architecture of the English Electric KDN2, KDF6 and KDF7 computers.**

The KDN2 (1962), KDF6 (1963) and KDF7 (1965) family of computers were relatively small machines developed by English Electric for process control applications. There were many KDN2 installations in the iron and steel industry. Each KDN2 computer cost about £25K. Each KDF6 cost about £60,000; many were installed in banks and similar commercial data-processing organisations.
